Feathered Dragons: Studies on the Transition from Dinosaurs to Birds (Life of the Past)

Meat-eating theropod dinosaurs have been recognized as potential ancestors of birds since the 19th century, but it was not until the 1960s that work on *Deinonychus* revealed the startling similarities between dinosaurs and birds. With each new small theropod find the ties became stronger, until the discovery of *Sinosauropteryx*? a dinosaur with feathers! Though not all scientists accept the concept of birds' being phylogenetically nested within the Dinosauria, others are now focusing on the evolution of feathers and avian flight. This book presents 15 new pieces of research, including the first detailed description of *Bambiraptor*, a remarkable new specimen from Montana.
